### EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.
2. Authorization for this examiner's amendment was given in a telephone interview with Harold Bennett on July 20<sup>th</sup>, 2009.
3. The application has been amended as follows:

**Claim 3 has been amended to now read:**

3. A pump/motor, comprising: a back plate having first and second fluid ports configured to be differentially pressurized; a plurality of reaction plates being separate bodies from, and rigidly coupled to, the back plate; a valve plate slideably coupled to the back plate and having first and second fluid feed channels configured to receive fluid from the first and second fluid ports, and a surface configured to receive a rotatable cylinder barrel; and a plurality of hold-down pistons distributed along first and second edges of a same surface of the valve plate in respective hold-down cylinders formed in the valve plate, each of the hold-down pistons configured to be biased, by pressurized fluid in the respective hold- down cylinder, against a surface of one of the reaction plates.

**Claim 8 has been amended to now read:**

Art Unit: 3746

8. A hydraulic machine, comprising: a back plate having a concave surface whose shape defines a section of a first cylinder on an axis, the concave surface following, as viewed in a first plane perpendicular to the axis, a first arc, and following, as viewed in a second plane transverse to the first plane and intersecting the concave surface, a straight line, the back plate being configured to slideably receive a valve plate thereon; first and second fluid ports formed in the concave surface and configured to transmit differentially pressurized fluid to the valve plate; and first and second reaction plates being separate bodies from, and coupled to, the back plate, each having a convex reaction surface whose shape and position defines a respective section of a second cylinder on the axis, the convex reaction surface of each of the first and second reaction plates following, as viewed in a respective plane lying parallel to the first plane and intersecting the concave surface, a second arc concentric to the first arc, and, as viewed in the second plane, a straight line, the reaction surfaces of the first and second reaction plates substantially facing, and spaced a selected distance from, the concave surface of the back plate.

**Claim 10 has been amended to now read:**

10. A method of operating a variable displacement hydraulic machine, comprising: coupling a first pressurized fluid source to a rotatable barrel via a first fluid feed channel in a valve plate and a first fluid port in a back plate; coupling a second pressurized fluid source to the rotatable barrel via a second fluid feed channel in the valve plate and a second fluid port in the back plate; changing the displacement of the machine by sliding the valve plate in an arc along a surface of the back plate; and

Art Unit: 3746

biasing a plurality of hold-down pistons along respective axes lying normal to the surface, against a reaction plate, which is a separate body from, and coupled to, the back plate.

**Claim 23 has been amended to now read:**

23. A pump/motor, comprising: a back plate having first and second fluid ports configured to be differentially pressurized; a plurality of reaction plates being separate bodies from, and rigidly coupled to, the back plate; a valve plate slideably coupled to the back plate and having first and second fluid feed channels configured to receive fluid from the first and second fluid ports, a surface configured to receive a rotatable cylinder barrel, and a plurality of hold-down cylinders; a cylinder barrel having a plurality of cylinders, rotatably positioned on the surface of the valve plate; and a plurality of hold-down pistons positioned in respective ones of the hold-down cylinders, each of the hold-down pistons configured to be biased, by pressurized fluid in the respective hold-down cylinder, against a surface of one of the reaction plates, the valve plate and cylinder barrel configured such that a net lifting force of the valve plate and cylinder barrel, exclusive of forces generated in the hold-down cylinders, is positive.

***Allowable Subject Matter***

4. Claims 1-8, 10-11, 13-20, and 22-24 are now allowed.
5. The following is an examiner's statement of reasons for allowance: the prior art does not teach or disclose a plurality of reaction plates being separately bodied from,

Art Unit: 3746

and rigidly coupled to, a back plate. Furthermore, the prior art does not show a plurality of hold-down pistons being biased against said reactions plates.

6. It is noted by the examiner, and stated here for the record of prosecution, that the aspect of the instant invention determined to be novel and patentably distinct from the prior art is the plurality of hold-down pistons being biased against multiple separately bodied reaction plates by pressurized fluid in an effort to keep a valve plate against the back plate.

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to PETER J. BERTHEAUD whose telephone number is (571)272-3476. The examiner can normally be reached on M-F 9am - 5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Devon Kramer can be reached on (571) 272-7118. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
